OPERATIVE REPORT

completed with 4-0 Monocryl. Once this was completed, Steri-Strips were placed to the skin level. The peri-incisional site was then injected with 0.25% Marcaine with epinephrine for postoperative pain management. Tourniquet was released without complications. A sterile dressing was then applied and secured in position with Webril and an Ace bandage. The patient tolerated the procedure very well. There were no complications. She was subsequently awakened, transferred to her bed, and taken to the recovery room in stable condition.
